A Phonetic Study on Chanting of Chinese Five Syllable Modern-Style Poems

Yang Feng

None of researches mentioned above has employed the method of phonetic analysis. This paper carries out phonetic study of 21 five-syllable modern-style poems chanted by Professor Tu An, trying to find out the prosodic hierarchy according to silent gaps, and probe the phonetic features and methods of chanting[3].

2. METHOD

2.1 Material and chanter

Poems recorded are five-syllable modern-style poems. The chanter is Professor Tu An, a 87-year old male scholar. He was born in Changzhou. He had been well-educated in old-style private school with proficiency in classic Chinese literature.

2.2 Recording

These poems are recorded in the Phonetic Lab. Each poem is recorded three times. The first time is reciting in standard Chinese, the second time is reciting in the chanter’s dialect, the third time is chanting in the chanter’s dialect. The software used in analysis is Praat.

3. RESULTS

3.1 Prosodic hierarchy and metrics

First the duration of each pause in chanting is detected, then the pauses are classified according to their durations as the marker of boundaries of prosodic levels. Figure 1 shows that the duration of pauses is distributed in three ranges: within 100ms, 300ms, and 1700ms. According to the three classes of pause duration in chanting, three levels of prosodic units can be identified: foot, prosodic phrase, and prosodic sentence. Prosodic boundaries agree with the metrics of poems.
Figure 1: The distribution of duration of each pause in chanting.

Boundaries between feet appear after “oblique-oblique” tonal combinations. As shown in Figure 2, the metrics of the sentence “ming cheng ba zhen tu” is “level-level-oblique-oblique-level”, the boundary between feet is after “ba zhen”, the combination of “oblique-oblique” syllables, with a gap of only 5ms. There is no obvious pause at the boundaries between feet, and no lengthening of syllables before foot boundaries.

Boundaries between prosodic phrases appear after “level-level” tonal combinations. That is, after the second or the fourth syllable of a five-syllable sentence. As shown in Figure 2, the longest pause appears after “ming cheng”, the “level-level” tonal combination, and before the boundary the syllable “cheng” lengthens. In average, the gap of the boundaries of prosodic phrases is 0.350s, the syllables before the boundary lengthen for 12%.

Figure 2: The wave and spectrograph of sentence “ming cheng ba zhen tu” in chanting, “level-level-oblique-oblique-level”

Boundaries between prosodic sentences appear at the final position of each line of the poem, being marked by doubling of the duration of syllables, which is the most obvious feature of chanting. As shown in Figure 2, the duration of the syllable “tu” doubles. The average duration of sentence final syllables is up to 1.7s. If the final syllable is a checked syllable, an exclamation is added to the syllable to reach the effect of lengthening. As in Figure 3, the sentence final syllable “bai” is a checked one in the chanter’s dialect, therefore, an exclamation “ai” is added and lengthened.

3.2 Chanting melody and metrics

In chanting syllables of level tone have a lower pitch while syllables of oblique tones have a higher pitch, forming the rise and fall in melody through alternation of level and oblique syllables. Sentences of same metrics have the same pattern of melody, and poems of same metrics are similar in melody.
As shown in Figure 4, all the three sentences are of “level-level-oblique-oblique-level” pattern and their melody curve. By combining sentences of the same metrical pattern, poems of the same metrics have the same melody, therefore, chanters may chant poems of the same metrics with similar melody.

4. CONCLUSIONS

From analysis above, the chanting of five-syllable modern-style poems has the following features:

- Pause exists after “level-level” tonal combinations.
- Before the break the duration of the syllable lengthens.
- The duration of syllables doubles in sentence final position. An exclamation is added when the sentence ends with a checked syllable.

The pitch of syllables with level tone is lower than that of syllables with oblique tones, alternation of level and oblique tones forms the chanting melody. Sentences and poems with same metrical pattern have the same chanting melody.

These are main features of the chanting of five-syllable modern-style poems, and also the main techniques of chanting. Chanting with this method and personal features would be a splendid works of voices.

This research is an analysis of one chanter, more chanters and various types of chanting of poems in different dialects will be included in future study.
